

Money in England

Ratio: Converting American Dollars to English Pounds

Tommy and his family were finally in England. He had saved up his spending money just for this trip. He had \$100 to spend as he liked. However, he had to convert (change) his money to English money. The English money was called 'pounds' and 1 pound was worth *more than* \$1. So Tommy had to figure out how many pounds he could get for \$100. The bank said that \$1.32 would buy 1 English pound. So it was summer vacation and Tommy had to do more math. Good thing he was good at it.

Tommy started by multiplying the number he knew, $\$1.32 = \pounds 1$. He did this until he got close to \$100.

$$\$1.32 = \pounds 1 \text{ multiply by } 1$$

$$\$2.64 = \pounds 2 \text{ multiply by } 2$$

$$\$5.28 = \pounds 4$$

$$\$10.56 = \pounds 8$$

$$\$21.12 = \pounds 16$$

$$\$42.24 = \pounds 32$$

$$\$84.48 = \pounds 64$$

Dad decided to show Tommy a better way. Since we know dollars we will figure out the value of \$1 in English pounds. How about we divide first, then multiply?

$$1 \div \$1.32 = .76$$

so

$$\$1 = .76 \text{ pounds}$$

How many pounds can Tommy get for \$100? _____
