Siempre invierte poner “patas arriba” la segunda fracción y cambia el **÷** a **x**, entonces multiplica. Mira nuestro problema ahora:

$\frac{1}{2} \div \frac{2}{4} =$ $\frac{1}{2} \div \frac{2}{5} =$ $\frac{1}{2} \div \frac{2}{6} =$

$\frac{2}{4} \div \frac{2}{4} =$ $\frac{2}{4} \div \frac{2}{5} =$ $\frac{2}{4} \div \frac{2}{6} =$

$\frac{1}{3} \div \frac{2}{4} =$ $\frac{1}{3} \div \frac{2}{5} =$ $\frac{1}{3} \div \frac{2}{6} =$

$\frac{2}{3} \div \frac{2}{4} =$ $\frac{2}{3} \div \frac{2}{5} =$ $\frac{2}{3} \div \frac{2}{6} =$
